# The Role of MMF in Lupus Nephritis: Is there any place left for cyclophosphamide?

#### **GERALD APPEL, MD**

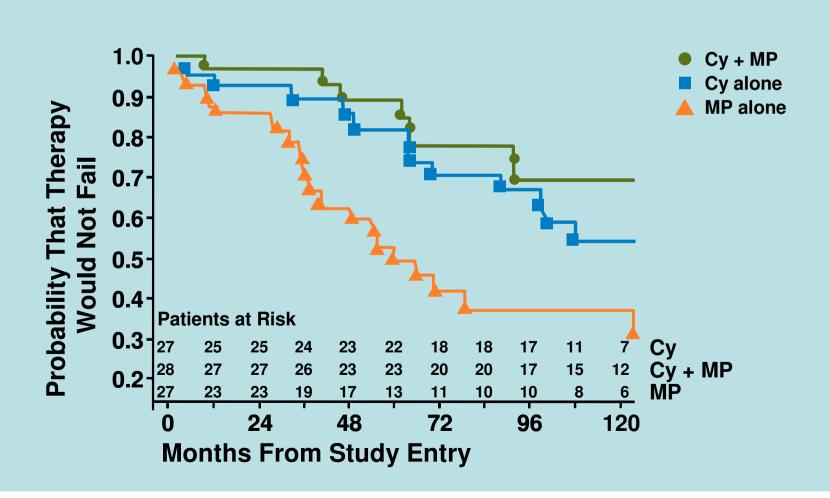

Professor of Clinical Medicine Columbia University –College of Physicians and Surgeons NY-Presbyterian Hospital New York, New York

#### Questions to be Answered

- Why did we need alternate therapy to cyclophosphamide? Efficacy? Toxicity?
- Did mycophenolate mofetil prove equally effective to cyclophosphamide?
- Did mycophenolate mofetil have fewer side effects?
- Does MMF work in severe DPLN?
- What is the role of MMF vs cyclophosphamide used in EuroLupus like regimens?

## Kaplan-Meier Analysis of Failure of Therapy

Illei GG, et al. Ann Intern Med. 2 001

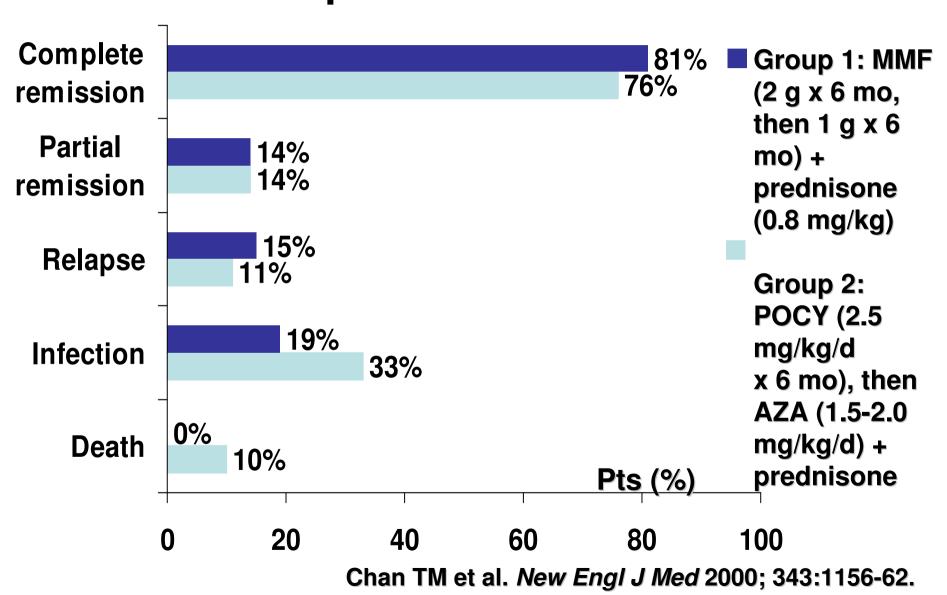

**Event** 

Cy Therapy Combination Therapy (n = 21) (n = 20)

	n/n	n/n
Hypertension	10/20	10/20
Ischemic heart disease	1/19	4/19
Hyperlipidemia	7/20	8/19
Valvular heart disease	9/19	7/21
Avascular necrosis	6/21	6/20
Osteoporosis	4/18	3/19
Premature menopause	9/16	10/18
Major infections	7/21	9/20
Herpes zoster infection	6/21	5/20

### Efficacy of MMF vs sequential POCY-AZA in 42 patients with DPLN

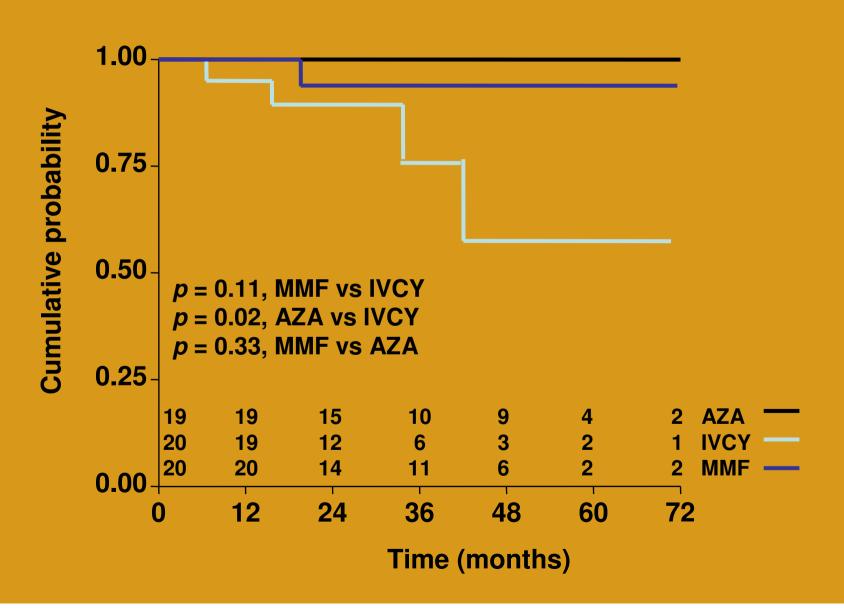

# Sequential Therapy for Proliferative LN IV Cy Induction – IV Cy vs. AZA vs. MMF Maintenance

```
N = 59 93% F 33 yo 46% AA
WHO III = 12 WHO IV = 46 Vb = 1
AI > 8 / 24 CI 1.9 - 3.6
```

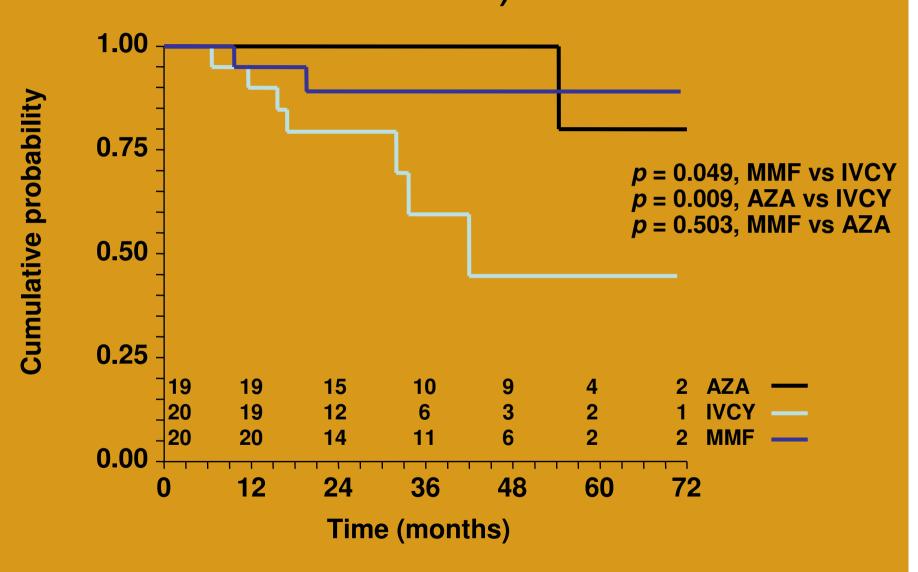

HBP > 95% Active Serology
Neph Synd 64% Palb 2.7 g/dl Up/Ucr > 5
Pcreat 1.6 g/dl

U. Miami G. Contreras et al. NEJM 2004

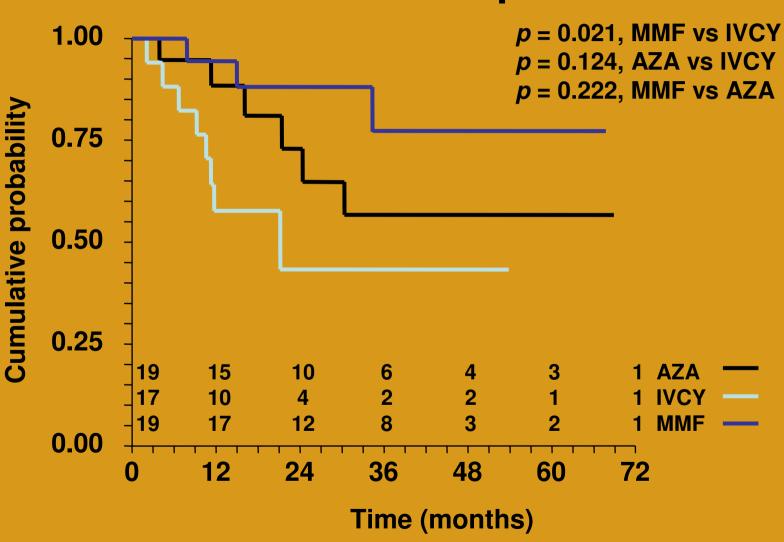

### Patient survival

## Free of clinical event (death or CRF)

### Relapse during maintenance phase – Free of Relapse

### Sequential LN Rx: IV CY vs AZA vs MMF Maintenance Therapy

**Side Effects of Therapy** 

Amenorrhea (%)	Infection (%)	Major (%)	
32	68	12	
	(%)	(%) (%) 32 68 7* 28*	(%)     (%)       32     68     12       7*     28*     3

### Multicenter Trial of MMF vs IVCyc for Induction Therapy of Severe LN

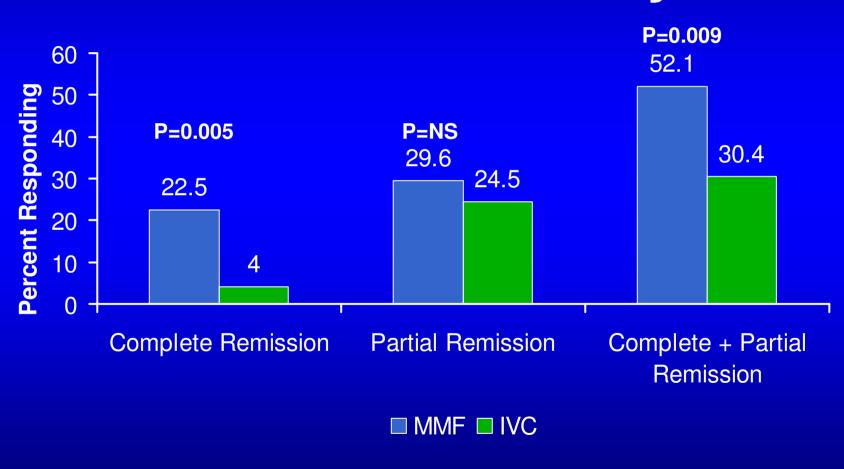

- Multicenter, randomized, nonblinded trial of induction RX of 140 patients with severe active LN
- Designed as equivalence trial
- Hypothesis: MMF has equivalent efficacy with superior tolerability profile vs. Intravenous cyclophosphamide

Ginzler E. ... Appel G N Eng J Med Nov. 2005

### **Baseline Patient Characteristics**

	MMF (n=71)	IVC (n=69)
Age ( yrs)	32.5 ± 10.0	31.0 ± 9.0
Female	61 (86%)	65 (94%)
Black	43 (61%)	36 (52%)
<b>Duration of SLE, mo.</b>	43.72 ± 66.88	58.70 ± 80.64
Screatinine, mg/dL	1.06 ± 0.52	1.08 ± 0.49
Urine protein, g/24 hr	4.06 ± 3.14	4.41 ± 3.51
Urine sediment		
RBC/hpf	24.1 ± 50.3	33.2 ± 115.5
WBC/hpf	12.6 ± 23.5	10.3 ± 17.3
Salbumin, g/L	2.81 ± 0.95	2.69 ± 0.56

# Remission Rates: MMF vs. IVC Intent to treat analysis

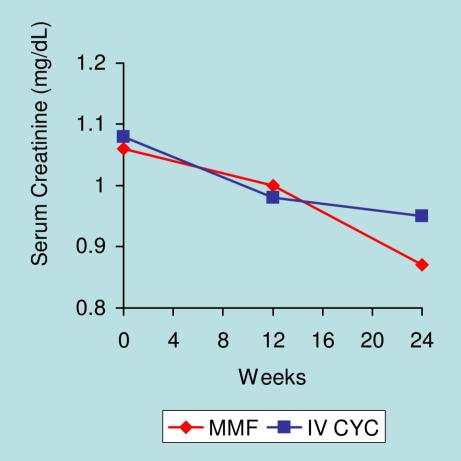

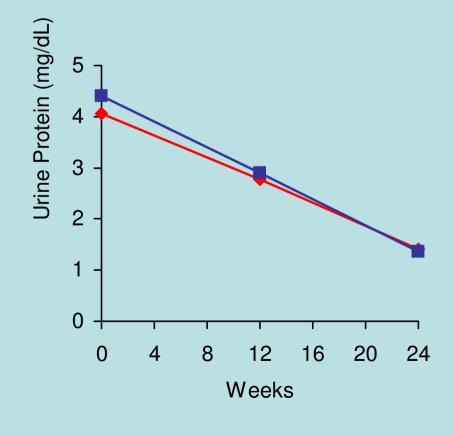

Ginzler E. ... Appel G N Eng J Med Nov. 2005

# Change in Serum Creatinine and Urine Protein Excretion

Serum Creatinine

**Urine Protein** 

### NEJM 11/05 Study – Last Outcomes

	MMF	IVC
<ul> <li>Renal Flare</li> </ul>	8	8
<ul> <li>Renal Failure</li> </ul>	4	7
<ul> <li>Death</li> </ul>	4	8

All p = NS at Mean follow-up 36 and 37 months

Ginzler E. ... Appel G N Eng J Med Nov. 2005

### ALMS TRIAL – RCT MMF vs IVC in Severe LN Appel, Contreras, Dooley et al JASN 2009

Randomized (n = 370)
Open-label treatment

IVC

Allocated to MMF (n = 185) Received MMF (n = 184)

> Withdrawals (n = 35)Due to adverse event (n = 24)Consent withdrawn (n = 6)Other reason (n = 5)

**Allocated to IVC** 

(n = 185)

Received IVC (n = 180)

Withdrawals (n = 29)

Due to adverse event (n = 13)Consent withdrawn (n = 5)Other reason (n = 11)

Primary endpoint: responders in randomized population (n = 370)

#### **Maintenance phase**

Double-blind re-randomization to corticosteroids plus MMF or azathioprine for up to 3 years

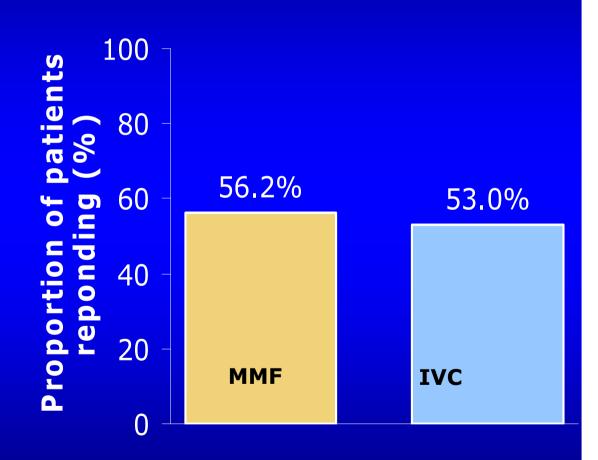

### **ALMS TRIAL Primary Endpoint: Responders at Month 6**

Response judged by blinded Clinical Endpoint Committee:

Decrease in proteinuria to <3g if baseline nephrotic (≥3g/d), or by ≥50% in patients ith subnephrotic (<3g/d) proteinuria

and

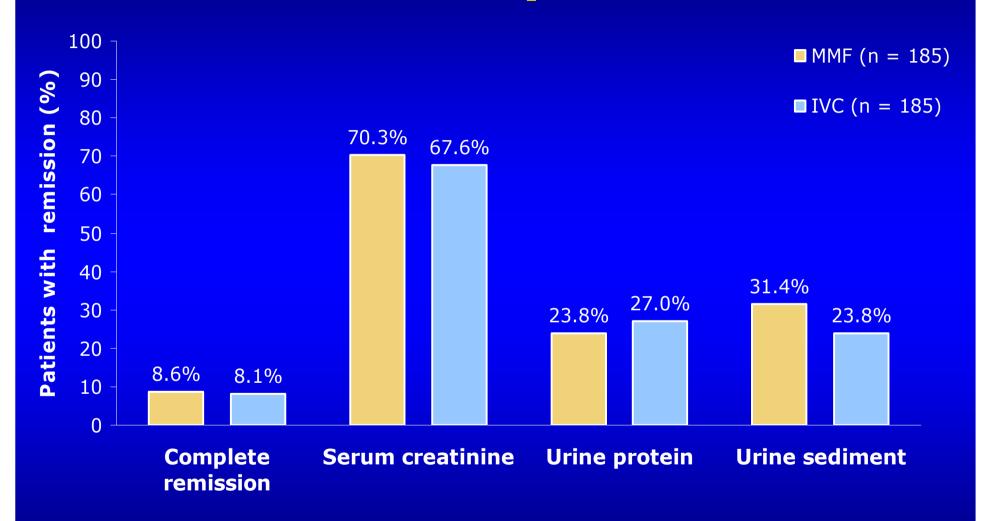

Stabilization of serum creatinine level (24-week level ± 25% of baseline), or improvement

MMF was not superior to IVC (p = 0.575)

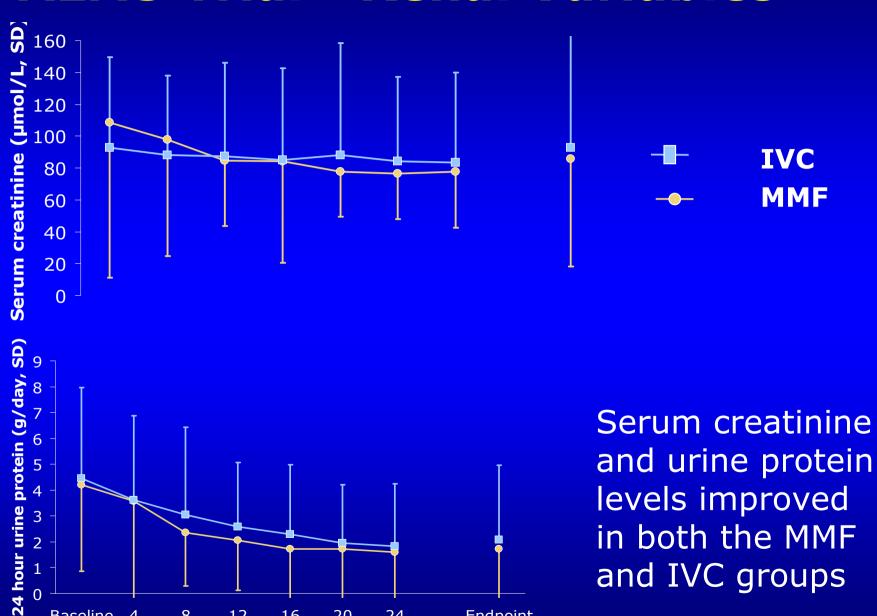

**Appel**, Contreras, Dooley et al JASN 2009

### Remission Rates by Renal Criteria

No significant differences between groups in complete remission or by individual criteria

#### **ALMS Trial - Renal Variables**

Baseline 4

8

12

16

Week

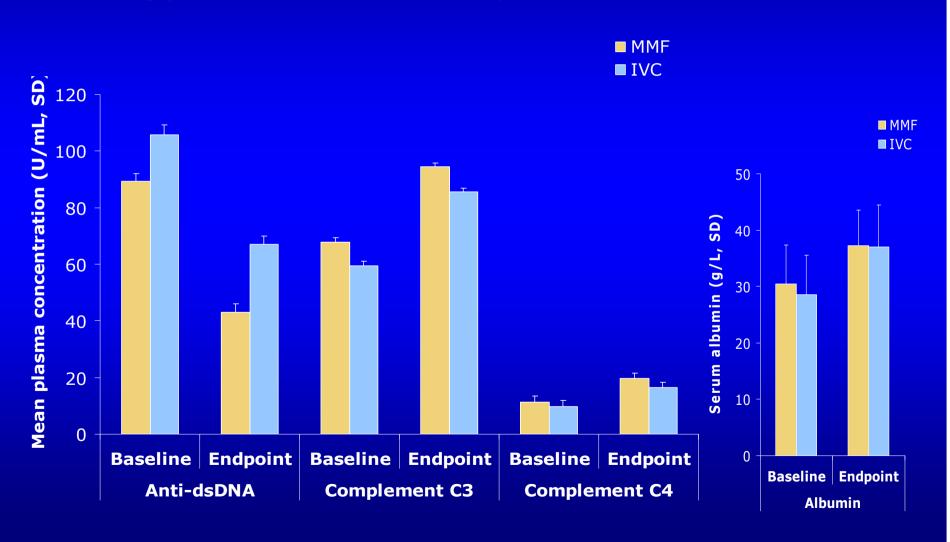

20

24

**Endpoint** 

### **ALMS - Key Non-Renal Variables**

Appel, Contreras, Dooley et al JASN 2009

## ALMS Trial - Adverse Events (AEs) Occurring in ≥10% of Patients

MMF (n = 184)	IVC (n = 180)

AE	n (%)	AE	n (%)
Diarrhea	52 (28)	Nausea	82 (45)
Headache	38 (20)	Vomiting	68 (37)
Peripheral edema	35 (19)	Alopecia	64 (35)
Arthralgia	29 (15)	Headache	47 (26)
Nausea	27 (14)	Arthralgia	43 (23)
Hypertension	26 (14)	Leukopenia	38 (21)
Nasopharyngitis	25 (13)	Pyrexia	30 (16)
Vomiting	25 (13)	Edema, peripheral	30 (16)
Cough	24 (13)	Nasopharyngitis	29 (16)
Anemia	23 (12)	URI	28 (15)
Alopecia	20 (10)	Hypertension	25 (13)
		Diarrhea	23 (12)
Deaths	9(4.9)	Deaths	5(3)

#### **ALMS Trial - Summary**

- Study did not show that MMF was superior to IVC
- Overall response rates similar with MMF and IVC in all renal and non-renal parameters
- Adverse Events for MMF and IVC were broadly similar over 24 weeks, and consistent with previous reports
- Ongoing maintenance phase compares MMF with azathioprine for up to 3 years

**Appel**, Contreras, Dooley et al JASN 2009

### MMF in LN with Poor Renal Function: Analysis of the ALMS Data

- Background: Controversy whether MMF is superior or equal to IV cyclophosphamide in LN with severe renal dysfunction.
- Methods: Post Hoc analysis of pts with a baseline GFR < 30 ml/min in the ALMS controlled trial of MMF vs IV Cyclophosphamide.
- Analysis: Change in renal function, proteinuria, overall response and adverse events.

Walsh M, Solomons N, Jayne D, for the ALMS group JASN 19: 780A, 2008.

### MMF in LN with Poor Renal Function: Analysis of the ALMS Data

29 Pts (18 MMF, 11 IVC).

Baseline: MMF vs IVC similar in age, proteinuria (5.1 and 4.6 g/day), chronicity on bx, and GFR (21 vs 24 ml/min).

No difference in composite outcome of response to proteinuria and Scr;

GFR increased 20 ml/min more with MMF;

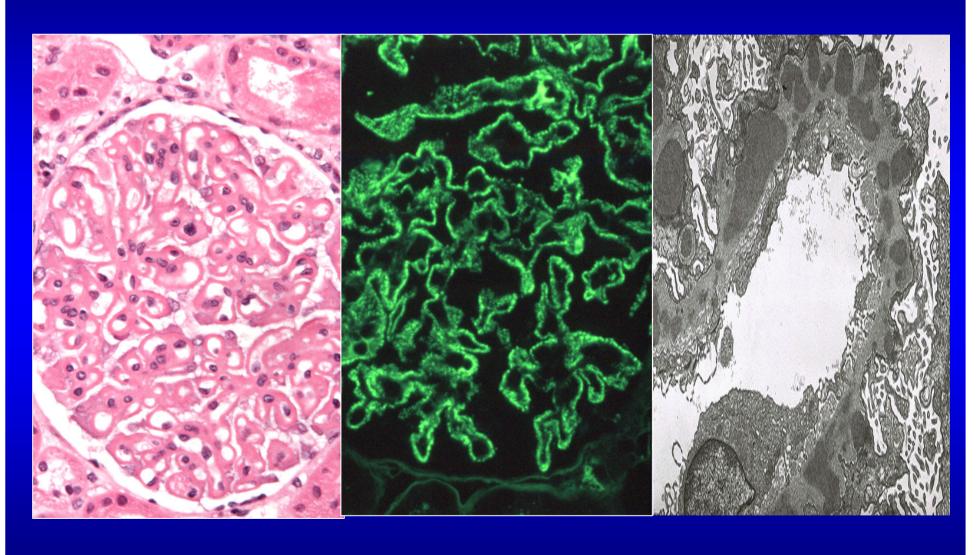

Proteinuria decreased (0.8g/d) more with MMF.

25% of both groups had treatment limiting adverse events.

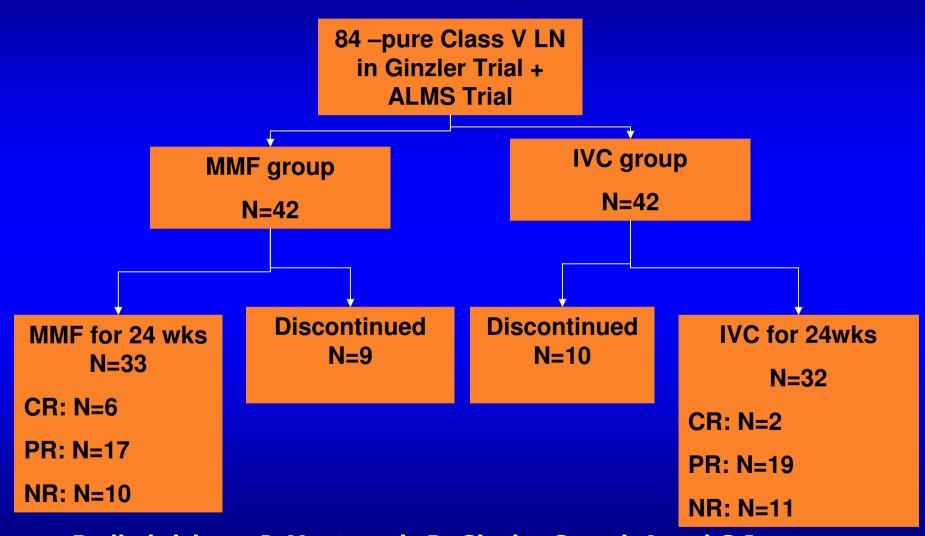

**Conclusion:** No evidence that IVC is more effective than MMF in pts with severe LN.

Walsh M, Solomons N, Jayne D, for the ALMS group JASN 19: 780A, 2008.

### Lupus Nephritis Class V

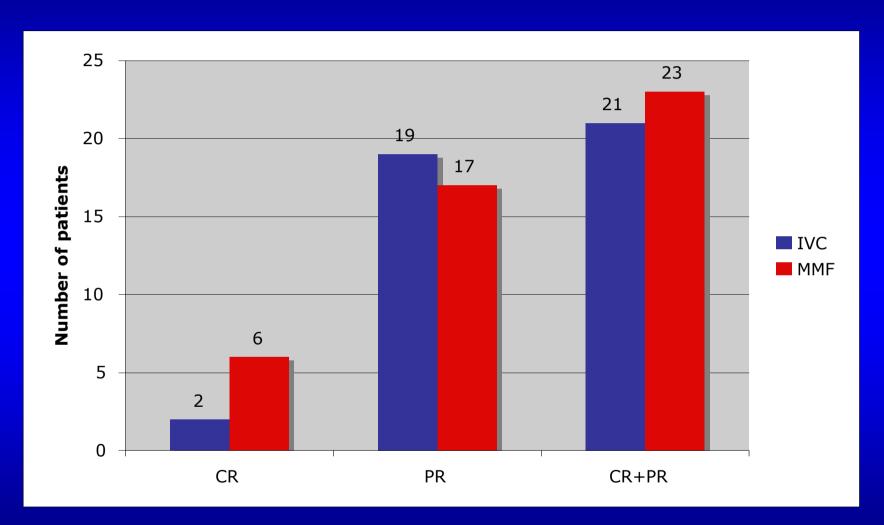

### Lupus Membranous Nephropathy: *IVC vs. MMF*

Radhakrishnan J, Moutzouris D, Ginzler G, and Appel G J Kidney Int. 77:152-160, 2009.

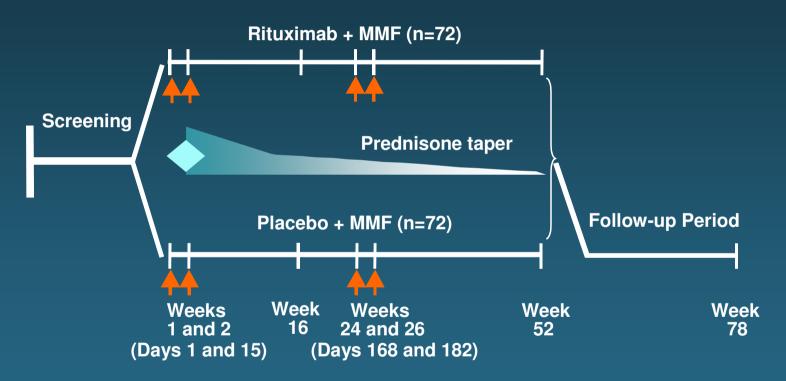

### **Absolute partial and Complete Remission Rates Membranous LN**

Radhakrishnan J, Moutzouris D, Ginzler E, and Appel G Kidney Int 77:152-160, 2009.

#### **LUNAR Study Design**

#### **Treatment Period**

4

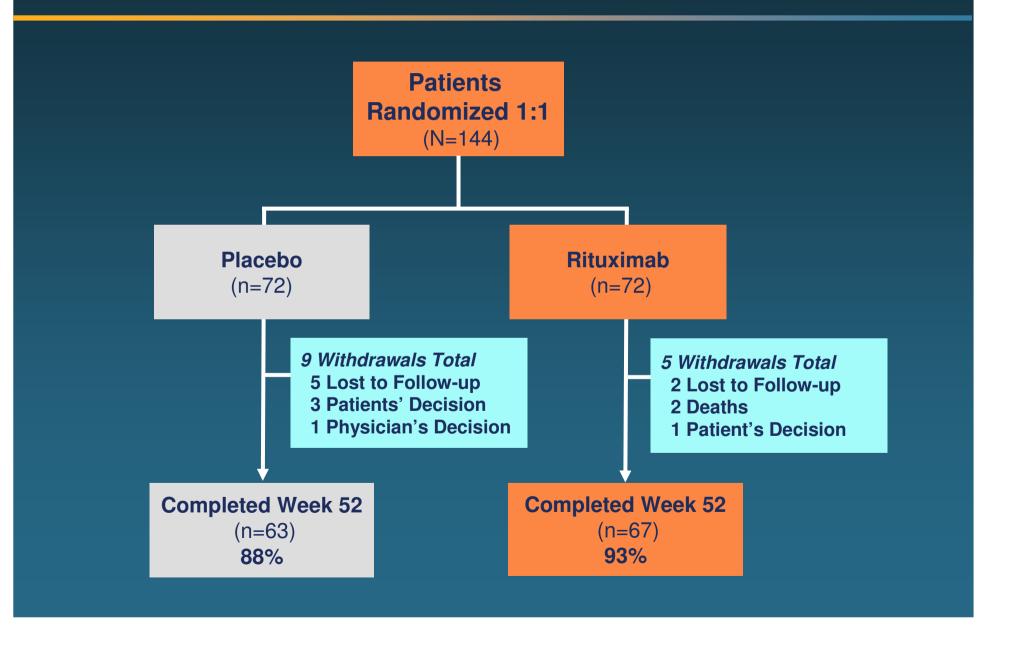

= Study drug infusion.

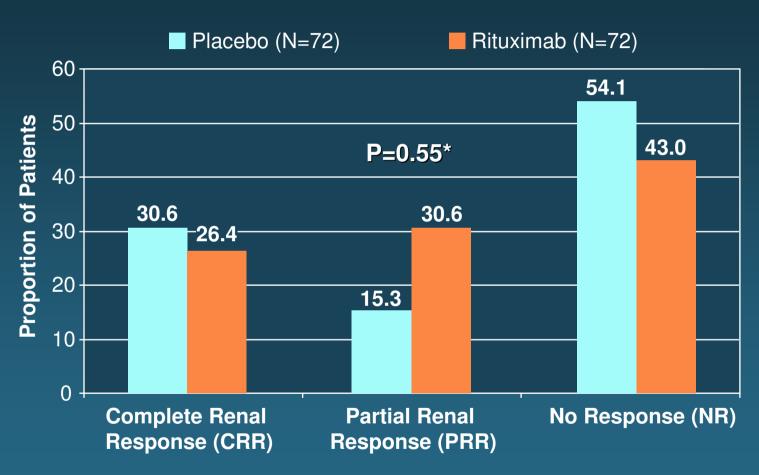

= Corticosteroids:

- 1000 mg IV methlyprednisolone given at days 1 and then days 2, 3, or 4
- Oral prednisone initiated at 0.75 mg/kg/day after IV steroids and then tapered to 10 mg/day by day 112

#### **Patient Disposition**

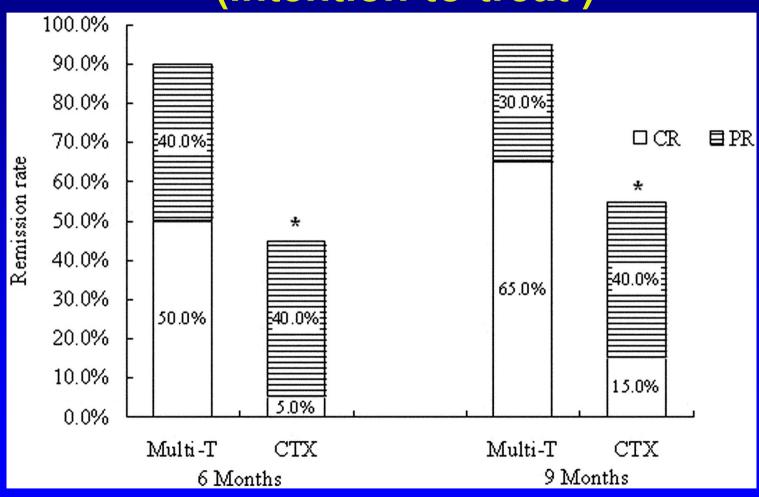

#### Primary Endpoint: Renal Response at Week 52

Furie R et al ACR 2009

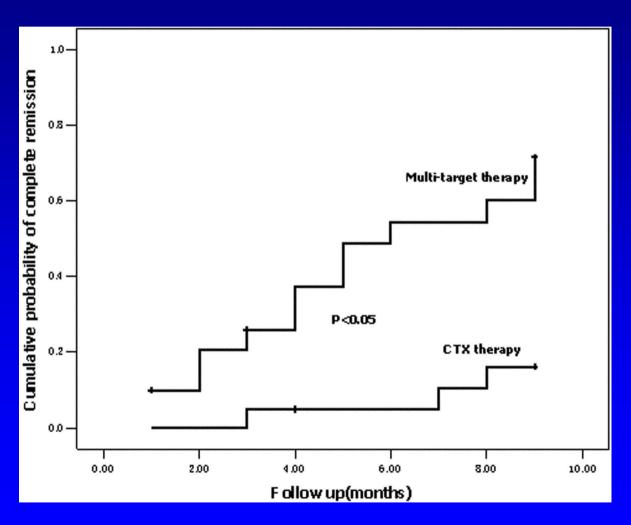

Mean MMF dose: Placebo: 2.4±0.62 g; Rituximab: 2.7±0.41 g

# Remission rates in the multitarget therapy and IVCY groups after 6 and 9 months (intention-to-treat)

Bao, H. et al. J Am Soc Nephrol 2008;19:2001-2010

# Probability of achieving complete remission for patients treated with multitarget therapy or IVCY

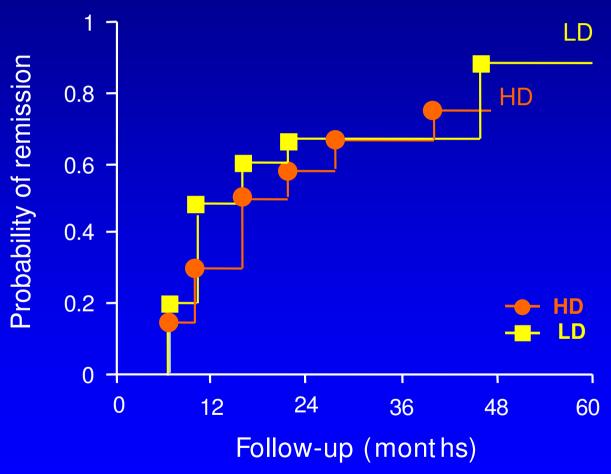

Bao, H. et al. J Am Soc Nephrol 2008;19:2001-2010

### The Euro-Lupus Nephritis Trial

- Multicenter prospecitive trial of 90 LN pts with Proliferative LN (WHO III,IV,Vc-d)
- High dose IVCYT (6 mo IVP + 2 quarterly pulses) vs Low dose IV CYT (IVP q 2 wks x 6 followed by AZA)
- Follow 41 months

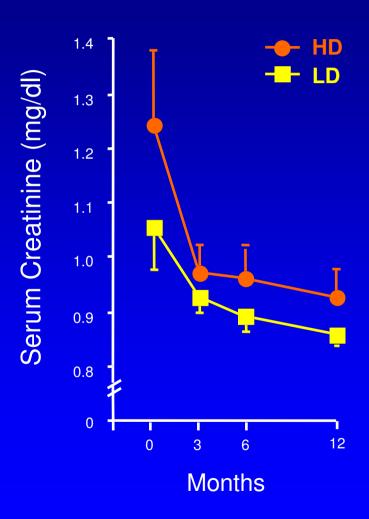

Houssiau et al. Arthritis & Rheumatisms 46: 2121-2131, 2002

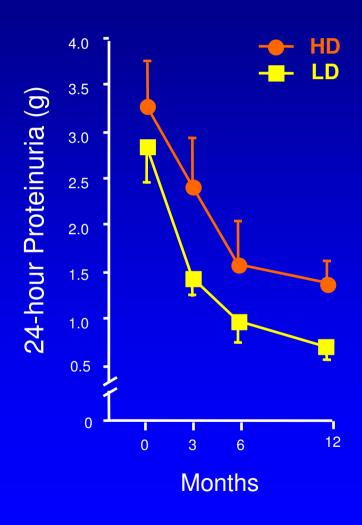

### **Euro Lupus Trial - Remission**

Remission: < 10 RBC/hpf, 24-h proteinuria < 1g, no DSC

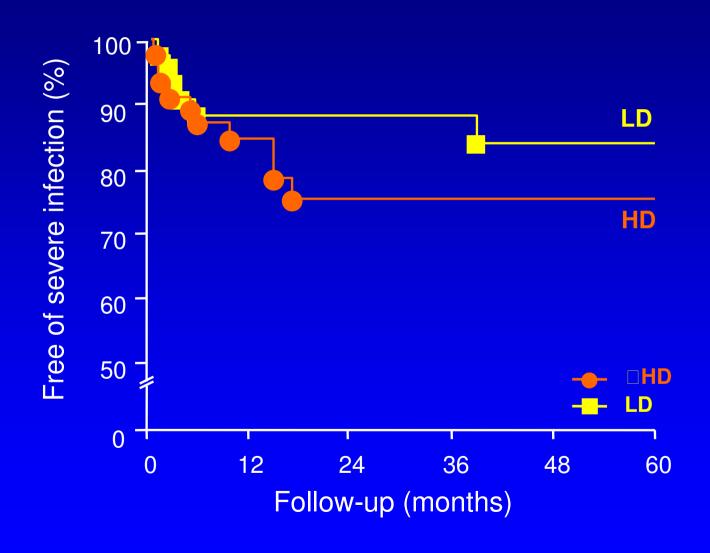

### Euro Lupus Trial Renal Findings

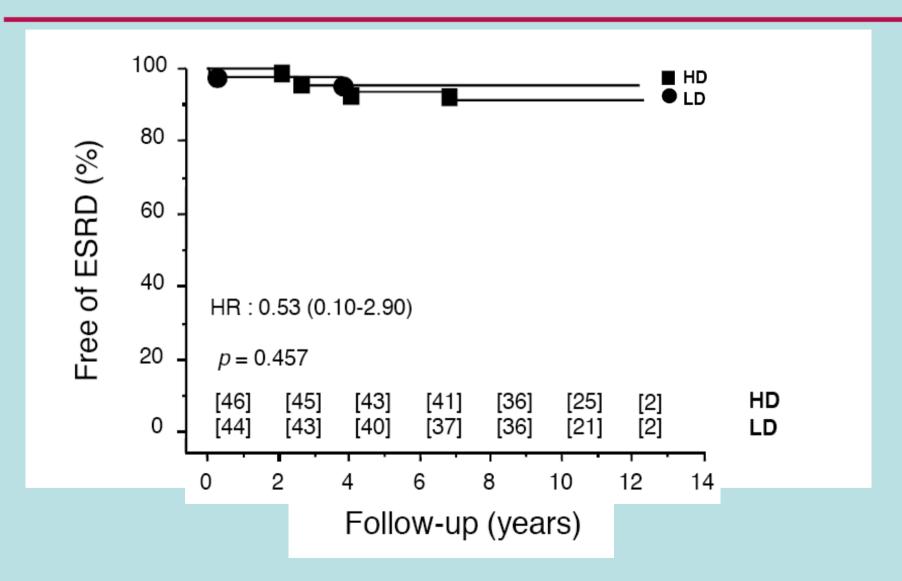

### Euro Lupus Trial - Severe infection

### ELNT - 10 year FU - ESRD

Houssiau FA et al. Ann Rheum Dis 2009,

### ELNT - 10 year FU

	All	High-dose	Low-dose
		IVCY	IVCY
Current serum creatinine (mg/dl)	$1.0 \pm 0.5$	$1.0 \pm 0.4$	$1.0 \pm 0.6$
Current 24h-proteinuria (g)	$0.6 \pm 1.2$	$0.6 \pm 1.3$	$0.5 \pm 1.0$
	<b>7</b> 2	7.1	7.5
Ongoing GC therapy (% of patients)	73	71	75
Ongoing IS therapy (% of patients)	56	59	53
Ongoing BP lowering therapy (% of patients)	68	68	67
Additional IS drugs ever received** (n)	$0.7 \pm 0.9$	$0.7 \pm 0.9$	$0.7 \pm 0.9$
Ever received MMF (% of patients)	30	30	29
Cumulative IVCY dose (g)	$7.6 \pm 2.5$	$9.5 \pm 2.5$	$5.5 \pm 4.8^{***}$

Houssiau FA et al. Ann Rheum Dis 2009, Jan 20 (Epub ahead of print)

### ELNT - 10 year FU - Conclusions

Euro-Lupus Regimen achieves good clinical results in the very long-term

#### Limitations:

Death and ESRD rates are low

Mainly Caucasians

Only moderately severe LN

Long-term IS (GC and other IS)

Referral centers

Houssiau FA et al. Ann Rheum Dis 2009,

#### **ALMS Maintenance Trial**

- All 277 patients in ALMS trial who received induction therapy with either IV cyclophosphamide or MMF and went into remission were randomized again after 26 weeks to either oral MMF or oral AZA.
- MMF 1 g BID vs Azathioprine 2 mg/kg for up to 3 yrs follow.
- Endpoint renal failure, ESRD, doubling creatinine, lack of renal remission.
- RESULTS AVAILABLE THIS WEEK!!!!!!!

### Conclusion

- MMF may be used as induction or maintenance therapy for both proliferative and membranous lupus nephritis.
- MMF is as effective as cyclophosphamide for severe lupus nephritis.
- MMF is at least as low in toxicity as cyclophosphamide. It is NOT without toxicity.
- There still is some role for cyclophosphamide, but with the EuroLupus regimen not the older NIH regimen.
